

Hello,

Thanks for taking a look at my first attempt at a Single Page Application (SPA). At the time of this document, I have been a Web Developer for a little over 6 months, and studying programming for about 9 months.

Inspired by an online tutorial, the original plan was for the SPA ViewModel to be fed data from the Northwind Database via JSON from a Web API. Although the API turned out great, running the SPA off of a local Web API is less than optimal without Http capabilities. For simplicity's sake, I've copied the API output JSON into a JS file that is then fed into the ViewModel via AJAX.

I was excited to use the Knockout Javascript library for the first time, which really makes it easy to expose your data when and where you need it in the HTML. This made it easy to focus on what I really enjoy, CSS and JQuery animations that make everything come alive.

I may later add more modules for the other tables in the Northwind database, such as orders, products, etc.

Note: Northwind.html runs best in Firefox or IE9, but Chrome has issues with local AJAX requests. Also, The Northwind Database is not included in this project.

Hope you enjoy playing around with this.

Sean Collins
